Cellulosic ethanol is ethanol (ethyl alcohol) produced from cellulose (the stringy fiber of a plant) rather than from the plant's seeds or fruit. It can be produced from grasses, wood, algae, or other plants. It is generally discussed for use as a biofuel. The carbon dioxide that plants absorb as they grow offsets some of the carbon dioxide emitted when ethanol made from them is burned, so cellulosic ethanol fuel has the potential to have a lower carbon footprint than fossil fuels.

The global 2G Cellulose Ethanol market size is projected to grow from US\$ 41.4 million in 2024 to US\$ 211 million in 2030; it is expected to grow at a CAGR of 31.2% from 2024 to 2030.
