The global 3-Chloro-2-Hydroxypropyl Trimethyl Ammonium Chloride market size is predicted to grow from US\$ 247 million in 2025 to US\$ 286 million in 2032; it is expected to grow at a CAGR of 2.2% from 2026 to 2032.

3-Chloro-2-hydroxypropyltrimethylammonium chloride (CTA) is an important cationic quaternary ammonium salt etherifying agent, appearing as white granular crystals or a liquid. It is primarily used to modify starch and cellulose through etherification reactions and is widely applied in the paper (for enhanced performance), textile, daily chemical, and water treatment industries.

The upstream core raw materials include epichlorohydrin (ECH) and trimethylamine hydrochloride (or trimethylamine). Epichlorohydrin is significantly affected by crude oil prices and the propylene/glycerol process, and is a key factor in determining production costs. Its production requires extremely high environmental standards, and the purity of the raw materials and reaction yield directly affect the content of impurities (such as dichloropropanol) in the final product.

Global sales are projected to reach 105,000 tons in 2025, with an average market price of approximately US\$2,400 per ton. The industry's gross profit margin is in the range of 20%-30%.

The core logic driving the growth of this industry lies in the performance demands of downstream applications and the mandatory implementation of environmental protection policies. Firstly, the paper industry is transforming towards packaging and functional applications, particularly in the special paper and high-strength corrugated paper sectors driven by express delivery and logistics. The use of cationic starch as a

reinforcing agent is continuously increasing in these areas. Secondly, with stricter global water resource management, its application as a key raw material in the synthesis of cationic flocculants is expanding in industrial wastewater decolorization and municipal sludge dewatering.
