The global 3,3,5-Trimethylcyclohexyl Salicylate market size is predicted to grow from US\$ 28.66 million in 2025 to US\$ 37.95 million in 2032; it is expected to grow at a CAGR of 4.1% from 2026 to 2032.

3,3,5-Trimethylcyclohexyl salicylate (CAS No.: 118-56-9) commonly known as Homosalate or Homomenthyl salicylate is an organic compound belonging to the salicylate class. In cosmetics and personal care products, it primarily serves as an oil-soluble UVB absorber, effectively filtering ultraviolet radiation within the 295-315 nm range; it is widely utilized in sunscreens, sun lotions, and daily chemical products to protect the skin.

The primary upstream raw materials are salicylic acid (synthesized from phenol and carbon dioxide) and 3,3,5-trimethylcyclohexanol (produced via the hydrogenation of isophorone). Fluctuations in salicylic acid prices are influenced by basic chemical raw materials and environmental protection policies, while the supply of trimethylcyclohexanol depends on the stability of the downstream isophorone fine chemical supply chain. The core of midstream production lies in the esterification process, which typically employs acid catalysis or solid-acid catalysis techniques, with a key focus on controlling malodorous impurities and the ratio of cis and trans isomers. Downstream application scenarios are highly concentrated within the personal care industry.

In 2025, global sales volume is projected to be approximately 10,000 tons, with an average selling price of around \$3,000 per ton. The industry's gross profit margin ranges between 20% and 35%.
