## Abstracts

The global 35kV Cold Shrink Intermediate Joint market size is predicted to grow from US\$ 243 million in 2025 to US\$ 410 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

The 35kV cold-shrink joint is a prefabricated joint used for connecting 35kV power cables. It is made of liquid silicone rubber, vulcanized and expanded in the factory. During on-site installation, only the support core rope needs to be removed; the rubber's own elasticity allows it to shrink tightly against the cable, achieving insulation, shielding, and sealing functions without the need for open flame heating.

Upstream industries mainly include suppliers of polymer materials such as liquid silicone rubber, companies producing metal conductor materials such as copper and aluminum, and manufacturers of extrusion molding and expansion equipment. Downstream industries cover power grid companies, power transmission and distribution engineering contractors, new energy power generation companies, and industrial users, achieving sales and application through power material bidding, engineering project support, and distributor channels. The global average price of inflatable above-ground swimming pools is \$350 per unit, with sales of approximately 710,000 units and global production capacity of approximately 750,000 units, resulting in an industry profit margin of 25%.

The global 35kV cold-shrink joint market is poised for growth driven by both technological upgrades and expanded applications. With the accelerated upgrading and transformation of global power grid infrastructure and the surge in demand for renewable energy grid connection, this market maintains steady growth. Technologically, products are evolving towards higher reliability and maintenance-free

operation, with continuous optimization of silicone rubber material formulations to improve aging resistance and anti-treeing performance. Installation processes are becoming more convenient, adapting to complex environments such as high altitudes, cold climates, and salt spray areas. Application areas are expanding from traditional power to new energy (wind power, photovoltaic), rail transit, and data centers, while the trend towards underground cabling is driving increased demand in urban power distribution networks. Simultaneously, the process of domestic substitution is accelerating, with leading domestic companies continuously increasing their market share due to their cost-effectiveness and service advantages.
