3D ground penetrating radar is a high-tech device used for underground exploration. It works based on the principle of electromagnetic wave reflection, emitting high-frequency electromagnetic waves underground through a transmitting antenna. When the electromagnetic waves encounter the interface of different media underground, reflected waves are generated, and the receiving antenna receives these reflected waves and processes and analyzes them. Unlike two-dimensional ground penetrating radar, three-dimensional ground penetrating radar can obtain three-dimensional spatial structure information of underground targets, which can more comprehensively and accurately reflect the shape, size, and spatial position relationship of underground objects. It is widely used in archaeology, urban underground pipeline detection, geological hazard investigation, and other fields.

United States market for 3D Ground Penetrating Radar is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for 3D Ground Penetrating Radar is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
