## Abstracts

According to this study, the global 3D ICs market size will reach US\$ 39350 million by 2031.

3D IC is an integrated circuit manufactured by stacking silicon wafers or dies and interconnecting them vertically using, for instance, through-silicon vias (TSVs) or Cu-Cu connections, so that they behave as a single device to achieve performance improvements at reduced power and smaller footprint than conventional two dimensional processes. 3D IC is just one of a host of 3D integration schemes that exploit the z-direction to achieve electrical performance benefits.

3D IC technology finds its applications in various end-use sectors such as consumer electronics, military, information and communication technology, automotive and aerospace among others. IC manufacturers use different fabrication process for 3D ICs, depending upon requirements of the circuit system such as beam re-crystallization, wafer bonding, silicon epitaxial growth and solid phase crystallization.
