A 3D low attachment cell culture plate is a specialized laboratory device designed to facilitate the growth of cells in three-dimensional (3D) structures, such as spheroids or organoids, by minimizing cell attachment to the plate's surface. It features a surface coating or material that reduces cell adhesion, allowing cells to aggregate and interact with each other rather than adhering to the plate. This design mimics the natural 3D microenvironment of cells in tissues, promoting more physiologically relevant cell behavior, including cell-cell and cell-matrix interactions, which are crucial for studying cell differentiation, tissue development, drug screening, and tumor biology. The plate typically consists of multiple wells or chambers, each providing a controlled environment for 3D cell culture, and is often used in stem cell research, cancer studies, and regenerative medicine to create more realistic in vitro models compared to traditional 2D culture systems.
