## Abstracts

The global 3D Photogrammetry System market size is predicted to grow from US\$ 2187 million in 2025 to US\$ 3967 million in 2032; it is expected to grow at a CAGR of 8.9% from 2026 to 2032.

In 2025, global sales of 3D photogrammetry systems reached approximately 43,000 units, with an average selling price of US\$52,000. A 3D photogrammetry system is a device that uses high-speed cameras, multi-angle optical acquisition, and computer vision algorithms to perform high-precision 3D reconstruction and measurement of object surfaces, structures, and spatial positions. It is widely used in aerospace, automotive manufacturing, precision parts processing, cultural heritage digitization, and scientific research. The upstream raw materials for this system mainly include high-resolution camera sensors, optical lenses, laser projection and light source components, high-precision supporting mechanical structures, and control electronic components. Downstream suppliers are mainly manufacturing enterprises, research institutes, testing and quality control centers, and digital mapping service organizations. 3D photogrammetry systems provide crucial inspection and modeling tools for high-end manufacturing and scientific research by acquiring spatial geometric data non-contactly, with high precision, and quickly. Future development trends focus on high speed, intelligence, automation, and multi-technology integration to meet the precise measurement needs in complex environments.
