3D Printing Bio-based Powder refers to a type of powdered substance processed from renewable natural resources such as plant fibers, starches, and proteins—natural high polymer materials—through specific techniques. This powder plays a crucial role in 3D printing technology, enabling the precise construction of three-dimensional structures with biocompatibility and degradability through a layer-by-layer deposition process. The use of bio-based powder in 3D printing not only contributes to reducing environmental impact but also creates scaffolds that match biological tissues, offering revolutionary solutions for the fields of tissue engineering and regenerative medicine. Its uniqueness lies in its excellent formability and stability during the printing process, combined with superior biodegradability and bioactivity, which promote cell growth and neovascularization, providing a solid foundation for constructing biomimetic tissues and organs.

United States market for 3D Printing Bio-based Powder is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
