3D printed food is a process of pre-processing (such as mixing and extruding) food materials into a layered structure through 3D printing technology (additive manufacturing technology), and then building it layer by layer according to the design model. Compared with traditional manufacturing technology, 3D printed food is highly personalized and customized, and can adjust the shape, taste, ingredients and even nutritional structure according to needs. It uses food materials as raw materials and processes them layer by layer through a special 3D printer to form complex and customized food.

United States market for 3D Printing Food Machine is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for 3D Printing Food Machine is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
