Available metal powders for 3D printing are mostly those being used in a range of applications (medical, aerospace, jewelry, automotive, etc.): Tool and maraging steels, Stainless steels, Aluminum alloys, Cobalt-chromium and nickel-based superalloys, Commercially pure titanium and titanium alloys, Copper alloys, Precious metals (gold, platinum, palladium, silver). Metal powders can vary widely in size, but also in shape (spherical to irregular). As a consequence, processing characteristics in 3D printing metal systems vary, as well. The common specifications of metal powders suitable for 3D printing are the spherical geometry of the particles resulting from the gas atomisation and a particle size distribution according to the layer thickness, usually between 10-50 µm. Material properties such as tensile strength, hardness and elongation, are important and often used as reference points for the decision about the right material.

The global 3D Printing Metal Powder market size is projected to grow from US\$ 523 million in 2024 to US\$ 1456 million in 2030; it is expected to grow at a CAGR of 18.6% from 2024 to 2030.
