The global 3D Printing of Metals market size is predicted to grow from US\$ 1609 million in 2025 to US\$ 3267 million in 2032; it is expected to grow at a CAGR of 11.2% from 2026 to 2032.

3D Printing of Metals, also called metal additive manufacturing, can produce metallic products through three - dimensional and printing technology. Now it is widely used in automotive industry, aerospace industry and medical industry. Metal 3D printer works by laying down metal powder. A high powered laser then melts that powder in certain precise locations based on a CAD file. Once one layer is melted, the printer will place another layer of metal powder on top, and the process repeats until an entire object is fabricated. In 2025, Global 3D Printing of Metals recorded estimated shipments of about 4,700 units, with an average selling price of around 350 k US\$/Unit.

The growth of the 3D Printing of Metals market is primarily driven by the rising demand for complex geometries, lightweight structures, part consolidation, and flexible small-batch manufacturing in high-end industries. Aerospace engines, rockets, satellites, gas turbines, medical implants, dental restorations, conformal-cooling molds, and high-performance industrial components increasingly require internal channels, lattice structures, thin walls, and integrated designs that are difficult or uneconomical to achieve through conventional machining, casting, forging, or welding. As multi-laser LPBF systems, large-format machines, closed-loop monitoring, powder management, process databases, and post-processing workflows mature, metal additive manufacturing is moving from prototyping and R&D validation toward low-volume production and qualified critical-part manufacturing.
