Abstracts

The global 3D Printing Polymer Powder Materials market size is predicted to grow from US\$ 1239 million in 2025 to US\$ 3031 million in 2032; it is expected to grow at a CAGR of 13.9% from 2026 to 2032.

3D printing polymer powder materials refer to granular thermoplastic polymer raw materials specially used for powder bed fusion additive manufacturing technology. During the printing process, they are melted by high-energy beams and stacked layer by layer to form a three-dimensional entity with complex structure and specific properties. This type of material usually has good thermal stability, fluidity, solubility and molding shrinkage control capabilities. Common polymer types include nylon (PA12, PA11), thermoplastic polyurethane (TPU), polyetheretherketone (PEEK), polyphenylene sulfide (PPS), polypropylene (PP) and carbon fiber/glass fiber reinforced composite powders, which are widely used in aerospace, automobile manufacturing, medical equipment, industrial tools, sports equipment and other fields. Unlike traditional injection molding pellets, 3D printing powder materials have higher requirements for particle size distribution, sphericity, hot melt behavior and reusability. Its molding quality directly affects the strength, precision and surface quality of printed parts, and is one of the key raw materials in high-performance additive manufacturing.

With the explosive growth in demand for high-performance customized parts in industries such as aerospace, automobiles, medical and electronics, the global 3D printing powder and polymer material market is expanding rapidly. Driving factors include: the continuous deepening of the application of polymer powders such as nylon (PA), PEEK, TPU in structural parts, medical implants, functional shells and other fields; the rapid implementation of multifunctional composite powders (carbon fiber/glass fiber reinforcement, conductive/antistatic powders, etc.) and degradable bio-based powders;

the popularization and upgrading of powder bed melting technology equipment such as SLS, MJF, HSS; the increasing maturity of green recyclable materials and powder recycling processes; the dual drive of digital transformation of manufacturing in the Asia-Pacific region and technological innovation in Europe and the United States. Looking to the future, with the continuous breakthroughs in material formulation and powder making technology, as well as the acceleration of the trends of "on-demand production" and "lightweight design", the 3D printing polymer powder material market will maintain a high double-digit growth rate in the next cycle, and further evolve towards high-end functionalization, refinement and sustainability.
