3D printing water soluble support filament refers to a type of material used in additive manufacturing processes, primarily fused deposition modeling (FDM). This filament serves as temporary support structures for complex or overhanging geometries during the printing of a main object. Unlike traditional support materials that require manual removal, water soluble support filament dissolves easily in water, leaving behind a clean and intricate final print. This technology streamlines post-processing efforts, particularly for intricate designs, by eliminating the need for manual support removal, thus offering significant advantages in terms of time and effort.

The global 3D Printing Water Soluble Support Filament market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
