The global 4-Ethenylphenyl Acetate market size is predicted to grow from US\$ 80.47 million in 2025 to US\$ 141 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

4-Ethenylphenyl Acetate is an aromatic vinyl ester monomer with the molecular formula $C_{10}H_{10}O_2$. The molecule contains a polymerizable vinyl group and an acetoxy functional group attached to a benzene ring, enabling it to participate in free-radical polymerization while providing a protected phenolic functionality. It is widely used as a specialty monomer and synthetic intermediate for the preparation of functional polymers, photoresists, advanced coatings, adhesives, electronic materials, and fine chemicals. Following polymerization, the acetoxy group can be hydrolyzed to generate hydroxyl-functional polymers with improved chemical reactivity and material performance.

In 2025, global sales of 4-Ethenylphenyl Acetate reached approximately 762 tons, with an average global market price of around US\$ 108/kg. As a niche chemical, its global production capacity is low, and its gross profit margin is approximately 20%-40%.

4-Ethenylphenyl Acetate is a niche, high-value specialty monomer primarily used in functional polymers, electronic materials, and fine chemical synthesis. Compared with commodity vinyl monomers, it is mainly employed in high-performance material systems where post-polymerization functionalization is required. The protected acetoxy group can be converted into a phenolic hydroxyl group after polymerization, enabling enhanced chemical reactivity, adhesion, thermal stability, and surface functionality. As a result, the material is widely utilized in functional resins, photoresist polymers, specialty coatings, advanced adhesives, and other high-performance polymer systems.

Market demand is increasingly supported by the development of advanced electronics, semiconductor manufacturing, high-performance composites, and specialty polymer technologies. Growing interest in precisely designed functional polymers and post-functionalizable monomers is creating additional opportunities for this material. However, commercial production requires stringent control of purity, polymerization inhibitors, and storage stability, resulting in relatively high technical barriers and a limited number of qualified manufacturers. Going forward, continuous innovation in electronic chemicals, functional polymer engineering, and advanced coating technologies is expected to support broader adoption of 4-Ethenylphenyl Acetate while maintaining its position as a specialized, high-value chemical rather than a bulk commodity.
