## Abstracts

The global 4-Hexylphenol market size is predicted to grow from US\$ 339 million in 2025 to US\$ 479 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

4-Hexylphenol is an alkylphenol compound ( $C_{12}H_{18}O$ ) formed by the substitution of a hexyl group onto the phenol ring, typically produced as a mixture of isomers (mainly para-substituted). It is primarily used as an intermediate in the production of antioxidants, specialty resins, surfactants, lubricant additives, and chemical intermediates for agrochemicals and coatings. The supply chain begins upstream with phenol (derived from the cumene process using benzene and propylene) and hexene or hexanol (from petrochemical olefin streams or oxo-alcohol processes). In the midstream, 4-Hexylphenol is synthesized via acid-catalyzed alkylation of phenol with hexene (or via alcohol routes), followed by separation and purification of isomers. Downstream, it is further processed into phenolic antioxidants (e.g., hindered phenols), resin modifiers, oilfield chemicals, and specialty additives, which are then supplied to industries such as plastics, rubber, fuels & lubricants, coatings, and agrochemicals. The market is typically integrated within the broader alkylphenol value chain, dominated by petrochemical and specialty chemical manufacturers with backward integration into phenol and olefin feedstocks. In 2025, global 4-Hexylphenol output was about 100,000 tons with 160,000 tons of capacity, average prices of USD 3,000-5,500 per ton, and gross margins around 23%.

United States market for 4-Hexylphenol is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for 4-Hexylphenol is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
