## Abstracts

The global 4 mm-6 mm Float Glass market size is predicted to grow from US\$ 13640 million in 2025 to US\$ 17310 million in 2031; it is expected to grow at a CAGR of 4.0% from 2025 to 2031.

Float glass is a sheet of glass made by floating molten glass on a bed of molten metal, typically tin, although lead and various low melting point alloys were used in the past. This method gives the sheet uniform thickness and very flat surfaces. Most float glass is soda-lime glass, but relatively minor quantities of specialty borosilicate and flat panel display glass are also produced using the float glass process.

As the construction and glass industries continue to evolve, 4 mm to 6 mm float glass plays an increasingly vital role in the market. This thickness range of float glass finds widespread application in modern architectural design for several compelling reasons. Firstly, 4 mm to 6 mm float glass strikes a balance between structural stability and providing an exceptional visual experience. Its moderate thickness effectively reduces the infiltration of external noise and offers excellent thermal insulation properties, contributing to enhanced energy efficiency in buildings, aligning with the trend towards sustainable construction.
