4D radiotherapy refers to any of the techniques when the movement of the tumor is taken into account, not only during treatment but also during planning. Four-dimensional radiation therapy (4DRT), also called respiratory gating, is a radiation treatment used to target tumors that move with a patient's breathing, such as lung, pancreatic, and other gastrointestinal cancers. It allows physicians to track the tumor's motion so precise radiation can target the tumor and limit damage to surrounding tissue.
