In telecommunications, a base station is a fixed transceiver that is the main communication point for one or more wireless mobile client devices.

A base station serves as a central connection point for a wireless device to communicate. It further connects the device to other networks or devices, usually through dedicated high bandwidth wire or fiber optic connections. Base stations are generally a transceiver, capable of sending and receiving wireless signals; otherwise, if they only transmitted signals out, they would be considered a transmitter or broadcast point. A base station will have one or more radio frequency (RF) antennas to transmit and receive RF signals to other devices.

Base stations are also central points that all clients connect to in a hub and spoke style network; it would not be a client among similar peers. Generally, if client devices wanted to communicate to each other, they would communicate both directly with the base station and do so by routing all traffic through it for transmission to another device.

Global 3 largest manufacturers of 4G & 5G LTE Base Station are Huawei, Ericsson and Nokia, which make up over 75%. Among them, Huawei is the leader with about 35% market share. Asia-Pacific is the largest market, with a share about 85%, followed by Europe and North America, with the share about 5% and 3%. In terms of product type, 5G Base Station occupy the largest share of the total market, about 55%. And in terms of product Application, the largest application is Mid-band (1-6 GHz), followed by Low-band (Sub-1 GHz).
