An oblique photography camera is a device that uses multiple sensors to collect images from different angles, such as from a vertical angle and four side angles. It can obtain high-resolution textures of the top and side surfaces of objects, truly reflect the conditions of the objects, and automatically generate a true three-dimensional real-life model using advanced positioning, fusion, modeling and other technologies. Unlike traditional vertical photogrammetry technology, oblique photogrammetry technology uses a camera with a larger tilt angle relative to the vertical direction to capture images, thereby obtaining more stereo information in the image. The five-lens oblique camera can break through the limitation of traditional aerial survey cameras that can only acquire images at a single vertical angle, and capture more detailed texture details of objects.
