The report requires updating with new data and is sent in 48 hours after order is placed.

The structure of the five-wire touch screen is similar to the four-wire resistive type, also having a lower wire (glass or film material) conductive ITO layer and an upper wire (film material) conductive ITO layer. The working principle of the five-wire touch screen is different from that of the four-wire resistive touch screen: the driving voltages in the X and Y directions of the five-wire touch screen are generated by the ITO layer of the lower line, while the upper line layer only acts as a detection voltage probe. Even if the upper line film layer is scratched or damaged, the touch screen can still work normally, so the service life of the five-wire resistive type is much longer than that of the four-wire type.

The global 5-Wire Resistive Touch Screen market size is projected to grow from US$ 4873 million in 2024 to US$ 6878 million in 2030; it is expected to grow at a CAGR of 5.9% from 2024 to 2030.
