The report requires updating with new data and is sent in 48 hours after order is placed.

The optical transceiver module mainly completes photoelectric conversion and electro-optical conversion. At the sending end, the electrical signal of the optical communication device is converted into an optical signal. After transmission through the optical fiber, the optical signal is converted into an electrical signal at the receiving end, and the information is processed by the device. The middlehaul & backhaul optical transceiver module in 5G is aimed at the communication bearer part of the connection between the specific DU and CU and the CU and the core network in 5G communication.
