As a new-generation digital infrastructure, 5G is becoming a new driving energy for economy and society development, providing fundamental network capabilities for the digitalization of thousands of industries. To meet the diversified requirements of vertical industries, 5G networks need differentiated network supporting capabilities, and 5G features such as network slicing are used to provide subdivided network services for vertical industries.

5G network slicing is a network architecture that enables the multiplexing of virtualized and independent logical networks on the same physical network infrastructure. Each network slice is an isolated end-to-end network tailored to fulfil diverse requirements requested by a particular application. For this reason, this technology assumes a central role to support 5G mobile networks that are designed to efficiently embrace a plethora of services with very different service level requirements (SLR).

From a business model perspective, each network slice is administrated by a mobile virtual network operator (MVNO). The infrastructure provider (the owner of the telecommunication infrastructure) leases its physical resources to the MVNOs that share the underlying physical network. According to the availability of the assigned resources, a MVNO can autonomously deploy multiple network slices that are customized to the various applications provided to its own users.
