A 5GHz bridge is a network device that utilizes the 5GHz frequency band for point-to-point or point-to-multipoint wireless data backhaul. It is commonly used for building interconnection, surveillance backhaul, campus access, and temporary communication coverage. Global shipments are projected to reach approximately 4 million pairs in 2024, with an average price of approximately $450 per pair. Typical single-line annual capacity is approximately 50,000 pairs. Upstream industries include RF chip and SoC supply, power amplifiers and RF front-ends, antenna and feeder manufacturing, sheet metal and housing processing, and power supply and heat dissipation component supply. Downstream markets primarily target carriers and internet service providers, security monitoring integrators, enterprise IT and industrial users, as well as engineering installation and system integrators. Typical gross margin is approximately 35%. The product cost structure is roughly as follows: RF chips, SoCs, antennas, and other key components account for approximately 55%; packaging and assembly account for approximately 15%; R&D and firmware development account for approximately 10%; testing and quality assurance account for approximately 5%; and sales, management, and logistics account for approximately 15%. Based on parameters, it can be divided into two structural types: split-type and integrated-type. Transmission protocols include WiFi 5, WiFi 6, and others. It can also be divided into three levels according to the transmission distance: less than 3 kilometers, 3 to 5 kilometers and greater than 5 kilometers.
