The global 5N Grade Graphite market size is predicted to grow from US\$ 134 million in 2025 to US\$ 253 million in 2032; it is expected to grow at a CAGR of 9.6% from 2026 to 2032.

In 2025, global 5N Grade Graphite production reached approximately 8960 Tons, the average price is US\$ 15,273 /Ton. 5N Grade Graphite is an ultra-high purity graphite material with a purity index of 99.999% (i.e., five '9s'), corresponding to an ash content typically below 10 ppm. Key impurity elements (such as boron, lithium, sodium, aluminum, and iron) are controlled at ppm or even sub-ppm levels. Compared to ordinary high-purity graphite, 5N grade graphite has extremely stringent restrictions on metallic impurities and elements with high neutron absorption cross-sections. Its preparation requires a combination of high-temperature gas-phase purification (such as halogen gas reaction) or multiple deep chemical purification processes, further removing trace impurities after complete graphitization. This material is mainly targeted at cutting-edge applications such as graphite substrates for semiconductor epitaxial furnaces, high-end fiber optic drawing heaters, precision mold EDM, and structural components for special nuclear reactors (such as molten salt reactors). It represents a high-value-added product at the pinnacle of the carbon materials field, reflecting a country's top level of high-purity carbon technology.

The global development of 5N grade graphite (99.999% purity) exhibits a significant pattern of technological monopoly and regional differentiation. Japan holds an absolute leading position, with companies like Toyo Carbon and Tokai Carbon possessing mature large-scale mass production technologies, and their products dominating the high-end markets globally, such as semiconductor epitaxial graphite substrates and fiber optic heaters. In Europe and the US, companies like SGL Carbon (Germany) and Mersen (France) possess small-batch production capabilities, primarily serving the aerospace, defense, and special nuclear energy sectors, but their production capacity is

smaller than Japan's. China is currently in a phase of rapid catch-up, with a few leading companies achieving laboratory breakthroughs and pilot production of 5N grade products, but there are still significant gaps in industrialization stability, batch consistency, and key impurity control compared to Japan. Overall, the 5N grade graphite market is highly concentrated, with Japan holding over 70% of the global high-end share, while China is accelerating its domestic production verification process.
