Abstracts

Nuclear magnetic resonance (NMR) spectrometer is the most powerful analytical tool currently available to an organic chemist. NMR allows characterization of a very small amount of sample (10mg), and does not destroy the sample (non-destructive technique). NMR spectra can provide vast information about a molecule's structure and can very often be the only way to prove what the compound really is. Typically though, NMR is used in conjunction with other types of spectroscopy and chemical analysis to fully confirm a complicated molecule's structure.

According to this study, over the next five years the 600 Million Nuclear Magnetic Resonance Spectrometer market will register a 4.0% CAGR in terms of revenue, the global market size will reach US\$ 130 million by 2024, from US\$ 110 million in 2019.
