Abstracts

The global 66KV Transformers for Wind Power market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The function of the 66KV transformer for wind power is to boost the 690V electric energy generated by the wind test transformer generator to 66KV, and then transmit the electric energy to the wind farm booster station through buried cables or overhead lines.

Compared with traditional 35kV transformers, 66kV liquid-immersed transformers can extend the transmission distance, improve energy transmission efficiency and system reliability, while reducing cable length, transmission loss and fault maintenance risks. A single large-capacity wind turbine matched with a 66kV large-capacity wind power transformer can reduce the number of wind turbines required for the overall project, reduce construction and operating costs, and help improve the profitability and sustainable development of wind power projects.
