The global 800V Solid-State Transformer (SST) market size is predicted to grow from US\$ 59.69 million in 2025 to US\$ 1176 million in 2032; it is expected to grow at a CAGR of 37.7% from 2026 to 2032.

An 800V Solid-State Transformer (SST) is a power-electronic transformer system designed to convert medium-voltage AC or other grid-side power into an 800V DC bus, while providing galvanic isolation, voltage regulation, bidirectional power flow, and digital power control. Compared with conventional transformer-plus-rectifier architectures, an 800V SST can reduce conversion stages and support compact, high-power DC distribution. It is mainly associated with AI data centers, high-density computing, EV fast charging, battery energy storage, microgrids, and DC-native power systems. In data centers, 800VDC is being promoted to reduce current, copper usage, and distribution losses.

Global production capacity is approximately 100 MW.

In 2025, global sales reached approximately 73 MW, with an average price of around US\$ 834 per kw, gross margin around 38%.

The 800V SST market is an emerging high-value segment within solid-state transformer and DC power distribution technology. Its strongest near-term opportunities are in AI data centers and high-power EV charging, where high power density, reduced copper usage, fewer conversion stages, and bidirectional energy management are increasingly important. However, the market is still at an early stage and faces challenges such as high cost, reliability validation, medium-voltage safety, DC protection, thermal design, and standardization. In the long term, as AI infrastructure, EV charging, energy storage,

and DC grids expand, 800V SSTs are expected to become an important enabling technology.

Market Trend

The 800V SST market is moving from research and demonstration toward early commercial positioning, especially in AI data center power architecture and high-power EV charging. The key trend is the shift from traditional low-voltage AC distribution to medium-voltage input and 800VDC output systems. NVIDIA has promoted 800VDC distribution for next-generation AI factories, while Eaton-related research has discussed medium-voltage SSTs for data center power distribution with 800VDC output. Wide-bandgap semiconductors such as SiC and GaN are becoming important because they enable higher switching frequency, smaller magnetic components, higher efficiency, and greater power density.

Market Drive

The main drivers of the 800V SST market are the rapid growth of AI data centers, high-density server racks, EV fast charging, and DC distribution systems. As rack power rises, traditional 48V/54V or 400V-class architectures face higher current, cable loss, copper cost, and thermal management pressure. 800VDC distribution can reduce current and improve power delivery efficiency, making it attractive for large-scale computing infrastructure. In EV charging, SST-based 800V DC charging systems can connect more directly to medium-voltage grids and reduce the number of conversion stages. These advantages support long-term demand for 800V SST solutions.

Upstream and Downstream

The upstream supply chain of 800V SST includes SiC and GaN power semiconductor suppliers, power module manufacturers, gate driver providers, high-frequency transformer suppliers, magnetic core producers, capacitor suppliers, sensor companies, cooling system suppliers, PCB manufacturers, protection-device suppliers, and digital control software developers. Key technologies include medium-voltage power conversion, high-frequency isolation, insulation design, thermal management, fast fault protection, and bidirectional control. Downstream customers mainly include AI data center operators, cloud service providers, EV charging infrastructure operators, battery storage integrators, utilities, microgrid developers, and industrial power users. Commercialization depends on cooperation among semiconductor companies, transformer manufacturers, power electronics firms, and end users.
