## Abstracts

According to this study, the global -80? Ultra-low Lemperture Fan market size will reach US\$ 207 million by 2031.

-80? ultra-low temperature fan is designed for extreme low temperature environment, and its core function is to maintain stable operation within this temperature range. This type of fan overcomes the performance degradation and material embrittlement problems that are prone to occur in ordinary fans at low temperatures through special material selection, structural design and refrigeration technology, ensuring that it can still work efficiently and reliably under ultra-low temperature conditions.

With the continuous development of the world's society and economy, the demand for air coolers in the fields of biomedicine, scientific research, aerospace, new energy, metallurgical industry, food industry and consumer electronics continues to grow. Traditional air cooler technology has many limitations under ultra-low temperature environments and small volumes, especially electronic components are prone to failure in environments below -40°C, which limits the service life and reliability of air coolers. Therefore, it is of great significance and value to solve the technical problems faced by traditional air coolers in ultra-low temperature environments and develop fully built-in axial flow air coolers suitable for ultra-low temperature environments to meet the growing needs of the international and domestic markets.

The -80°C ultra-low temperature fan industry is currently in its initial development stage, with high technical barriers but large market space. At present, only a few companies with core technologies in the world can produce them, and most of them are special customized products.
