A 96-well spheroid microplate is a specialized laboratory tool designed for the high-throughput formation and culture of cell spheroids in a 3D environment. Composed of 96 individual wells arranged in an 8x12 matrix, the plate features a non-adhesive surface coating (such as ultra-low attachment polystyrene or hydrogel) that minimizes cell adhesion to the well walls, promoting natural cell aggregation into spheroids. Each well is typically engineered with a specific geometry—often spherical or cylindrical depressions—to encourage uniform spheroid formation and size consistency, which is critical for reproducible experiments. The microplate format enables parallel processing of multiple samples, making it ideal for high-throughput screening of drugs, toxins, or biological factors, as well as for studying cell behavior in 3D models of tissues, tumors, or organoids. Its compact design supports efficient use of reagents, cells, and culture media, while facilitating automated imaging and analysis, thus streamlining research in cancer biology, stem cell studies, drug discovery, and regenerative medicine.
