The global AAV Capsid Protein Characterization Analysis market size is predicted to grow from US\$ 41.09 million in 2025 to US\$ 143 million in 2032; it is expected to grow at a CAGR of 19.2% from 2026 to 2032.

AAV capsid protein characterization analysis refers to third-party laboratory services that provide capsid-related quality attribute testing for AAV gene therapy vector development, process development, GMP support, and regulatory release. Key analyses include VP1/VP2/VP3 identity and ratio, capsid protein peptide mapping, intact/subunit mass, PTMs, degradation variants, empty/full capsid ratio, and certain structural integrity assessments. The overall gross margin is estimated at approximately 52%.

AAV capsid protein characterization is not a high-volume general assay but a high-value specialized service embedded within gene therapy CMC. Demand arises as AAV projects progress from early research to IND, process scale-up, GMP batches, and comparability studies. Clients prioritize method reliability, sequence coverage, empty/full capsid determination, and regulatory interpretability over single-run cost.

Market growth outpaces traditional bioanalytical services, driven by ongoing challenges in AAV vector development such as empty/partial capsids, aggregation, VP ratio drift, engineered capsid variants, and PTM control. Public market data also indicate that viral vector manufacturing and testing markets maintain high growth, with AAV remaining one of the core vector types.

The competitive landscape is concentrating around ?method platform + GMP compliance + regulatory submission experience.? Standard SDS-PAGE, ELISA, or

basic CE services face strong pricing pressure, whereas LC-MS/MS peptide mapping, intact/native MS, AUC, TEM, and multi-method orthogonal CQA packages retain significant premium pricing.
