## Abstracts

The global AAV Vector CDMO Services market size is predicted to grow from US\$ 172 million in 2025 to US\$ 681 million in 2032; it is expected to grow at a CAGR of 22.2% from 2026 to 2032.

AAV (Adeno-Associated Virus) vector CDMO service refers to a service provided by biotechnology companies in the field of gene therapy and vaccine development, providing customers with comprehensive technical support from AAV vector construction, production to purification. By using AAV vector CDMO services, customers can focus on the core scientific issues of gene therapy and vaccine development, while handing over the production and quality control of AAV vectors to professional service providers, thereby accelerating product research and development. and listing process.

Adeno-associated virus (AAV) belongs to the family Parvoviridae, and its genome is approximately 4.8 kb of single-stranded DNA, non-enveloped. Only with the help of helper viruses such as adenovirus or herpesvirus, the host can produce infectious AAV (adeno-associated virus). The recombinant adeno-associated virus vector (rAAV) used in the research field is a gene vector modified from non-pathogenic wild-type AAV. There are multiple serotypes of AAV. The main difference between AAV vectors of different serotypes is the capsid protein. The protein structures of different capsid proteins bind to different extracellular receptor molecules, so different serotypes have different targeting affinities to tissues or organs. Generally speaking, AAV has 12 serotypes and more than 100 variants. Due to its high safety, low immunogenicity, and long expression cycle, AAV is known as the most suitable tool for studying gene function in vivo.
