Abdominal retractors are medical devices used in surgical operations, mainly used to pull and fix abdominal tissues or organs, providing surgeons with a clear field of vision and sufficient operating space. There are many types of such devices, including manual, spring-loaded and self-locking types, which are commonly used in complex operations such as abdominal surgery, gynecological surgery, and hepatobiliary and pancreatic surgery. The use of retractors can reduce tissue damage and improve surgical efficiency and safety.

With the development of minimally invasive surgery and intelligent medical technology, abdominal retractors are evolving towards intelligence, modularity and more ergonomics. In the future, retractors will pay more attention to lightness, maneuverability and integration with equipment such as laparoscopes. Functions such as automatic adjustment of pulling force and remote control positioning are gradually being realized. In addition, the use of reusable and environmentally friendly materials has also become a research and development focus to improve the sustainability and cost-effectiveness of medical devices.
