Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Made of high-quality stainless steel. It is composed of an outer sheath tube and a blunt head inner core. The end of the outer sheath is an inclined plane, forming a sharp oblique edge. The inner core is slightly longer than the outer sheath. The rear end is equipped with a spring, which can stretch the needle tip beyond the outer sheath. When the puncture needle is pressed against the abdominal wall, the blunt head retracts, exposing the cutting edge of the puncture needle to penetrate the tissue. Once the puncture needle penetrates the peritoneum, the blunt head will automatically pop out, so as to protect the abdominal viscera. The head end of the outer sheath is also equipped with a valve and a standard interface. When the valve is opened, the air flows from the standard interface, through the valve, and into the abdominal cavity from the gap between the outer sheath and the inner core. The air flow and pneumoperitoneum pressure are controlled by the set value of the automatic pneumoperitoneum machine.
