An ultra long-range LiDAR is a highly advanced type of laser-based sensing technology designed to detect and measure objects at extreme distances, often exceeding 300 meters and in some cases reaching over 1,000 meters. This type of LiDAR operates by emitting powerful laser pulses—typically in the 1550 nm wavelength range for enhanced eye safety and performance—and measuring the time it takes for the light to bounce back from distant targets. Ultra long-range LiDAR systems are engineered for applications that demand precise spatial awareness at long distances, such as high-speed autonomous vehicles, aerial surveying, military reconnaissance, and large-scale infrastructure monitoring. These sensors provide highly detailed 3D point clouds even under challenging environmental conditions, making them indispensable for scenarios requiring long-distance object detection, high-resolution mapping, and early hazard identification.
