Above ground grease traps are a type of oil-water separation pretreatment equipment installed above the ground. They are commonly used in restaurant kitchens, food processing or other places that produce oily wastewater. Its internal structure usually includes a water inlet area, a sedimentation area and a grease separation area. It uses the density difference between grease and water to make the grease float up and solid impurities sink to the bottom after the wastewater flows into the equipment, so that the water is effectively intercepted before entering the downstream drainage network. The equipment is mostly made of corrosion-resistant stainless steel, polyethylene or anti-corrosion concrete. There is no need to dig too deep during installation, which is convenient for on-site layout and later maintenance. Because the above-ground installation form can more intuitively monitor the accumulation of grease, maintenance personnel can quickly open the cleaning cover for regular cleaning, reduce the risk of blockage, ensure that emissions meet standards and extend the life of the overall sewage treatment system. Regular maintenance and timely cleaning are the key to ensuring separation efficiency and meeting regulatory requirements.
