An abrasive compound is a product used to sharpen or polish material surfaces, typically available in powder or granular form, but also used in a broader sense when mixed with water or oil.

In the past, abrasives were made by grinding natural materials like garnet. Nowadays, most abrasives are artificially manufactured, with materials such as granulated alumina, silicon carbide, diamond, and others being used depending on the material being processed and the intended purpose.

The abrasive compound is rarely used alone. For greater convenience, they are often hardened with a bonding agent and used as artificial grinding stones, or adhered to paper or cloth and used as abrasive sheets.

The global Abrasive Compounds market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
