An absorbable perirectal spacer is a medical device used in radiation therapy for the treatment of prostate cancer. It is designed to temporarily create space between the prostate and the rectum, reducing the radiation dose received by the rectal wall during treatment and thereby minimizing the risk of radiation-related side effects. The spacer is typically composed of biodegradable materials that are safe for implantation in the body. Once inserted into the perirectal space (the space between the prostate and the rectum), the spacer gradually absorbs over time, eventually dissolving completely within the body.

The global Absorbable Perirectal Spacer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
