The global Absorbable Suture Anchors market size is predicted to grow from US\$ 46.02 million in 2025 to US\$ 67.97 million in 2032; it is expected to grow at a CAGR of 5.8% from 2026 to 2032.

Absorbable suture anchors are biodegradable implants used for soft tissue-bone fixation in orthopedics. They are made from absorbable polymers such as polylactic acid (PLLA), polyglycolic acid (PGA), or their copolymers (e.g., PLGA), and pre-loaded with high-strength non-absorbable sutures (usually ultra-high molecular weight polyethylene, UHMWPE). They gradually degrade into carbon dioxide and water over 6?24 months post-surgery, avoiding the need for secondary surgery. They are suitable for adolescent patients, superficial joints, or specific clinical scenarios where metal/PEEK implants are contraindicated. The upstream of the industry chain includes medical-grade PLA/PGA resin, UHMWPE fiber, injection molding and precision machining equipment, and sterilization service providers. The midstream consists of orthopedic companies with Class III medical device registration certificates, requiring expertise in material degradation rate control, mechanical strength maintenance, suture integration, and biocompatibility verification. The downstream primarily targets sports medicine and orthopedic departments in tertiary hospitals, entering clinical applications through high-value consumables distributors or national/provincial orthopedic centralized procurement. Due to high material costs, complex manufacturing processes, and relatively limited indications, the overall gross profit margin of the industry is between 45% and 65%, slightly lower than that of non-absorbable anchors. In 2024, the global production of absorbable anchors with wires was approximately 270,000 units, with a global average market price of approximately US\$168 per unit. In 2024, the global production capacity of absorbable anchors with wires was approximately 350,000 units.

The Absorbable Suture Anchors market is experiencing steady growth driven by the increasing adoption of minimally invasive orthopedic procedures and the demand for bioabsorbable implants. Compared with traditional metal anchors, absorbable anchors significantly reduce long-term complications and eliminate the need for secondary removal surgeries. Continuous improvements in polymer strength, degradation control, and fixation reliability are enhancing clinical acceptance. Sports injury treatment, aging-related joint degeneration, and the expansion of arthroscopic surgery are key demand drivers. Meanwhile, healthcare infrastructure upgrades in emerging markets further support long-term industry expansion.
