The recirculation pump of the absorption tower is installed beside the absorption tower to recycle the spray liquid in the absorption tower. Single-flow and single-stage horizontal centrifugal pumps are adopted, including pump casing, impeller, shaft, guide bearing, outlet elbow, bottom plate, inlet, seal box, shaft seal, foundation frame, anchor bolt, mechanical seal and all pipes, valves, local instruments and motors. The working principle is that the centrifugal force generated by the high-speed rotation of the impeller

makes the fluid obtain energy, that is, the pressure energy and kinetic energy can be improved after the fluid passes through the impeller, so that it can be transported to a high place or a distance. At the same time, negative pressure is formed at the inlet of the pump so that the fluid can be continuously sucked in. The pump head is made of corrosion-resistant material.
