Abstracts

The global AC Hydraulic Power Packs market size is predicted to grow from US$ 1587 million in 2025 to US$ 2156 million in 2032; it is expected to grow at a CAGR of 4.6% from 2026 to 2032.

In 2024, the global production of AC hydraulic power packs is 972,000 units, with an average price of US$1,603.9 per unit.

An AC hydraulic power pack is a hydraulic power unit that utilizes an AC motor as its power source. It typically consists of an AC motor driving a hydraulic pump, which converts mechanical energy into hydraulic energy. This energy is then transferred to actuators via hydraulic fluid (usually hydraulic oil), thereby achieving the power drive functions of various hydraulic systems.

The AC hydraulic power pack market is currently experiencing a period of stable growth and structural upgrades. This growth is driven primarily by stable demand from downstream industries, particularly in the fields of construction machinery, general manufacturing, port and terminal equipment, wind power and offshore platforms, automotive manufacturing, and automation equipment, all seeking replacement and upgrade opportunities for electric-driven hydraulic solutions. Furthermore, industrial electrification, energy efficiency and safety regulations, and a preference for power packs with higher levels of integration and intelligence (including sensors and electronic control units) are driving the market from the traditional "complete pump, valve, motor, and tank" model to a modular, standardized model with remote monitoring capabilities.

The upstream supply chain primarily includes motors (AC asynchronous/servo), hydraulic pumps (gear pumps, plunger pumps), electronic controls (variable frequency

drives, PLCs/embedded controllers), valves and accessories (relief valves, check valves, oil filters, coolers, etc.), and fluid materials. The midstream comprises power pack manufacturers (providing complete power units and integration services), while the downstream segment includes end-equipment manufacturers and construction companies. In recent years, the localization of hydraulic components has progressed significantly. Leading domestic companies have expanded their pump, valve, cylinder, and electronic control capabilities through vertical integration or mergers and acquisitions, gaining advantages in cost, supply, and customization, leading to an increase in production capacity concentration among complete machine manufacturers.

Gross profit margins vary significantly across companies and product lines. Standardized, scaled-up, mid- and low-end power packs have relatively low gross profit margins, while high-value-added customized power packs, integrated electronic controls, and service contracts can generate higher gross profits. Some leading domestic companies have achieved significant gross profit margin increases in recent years through product mix optimization and penetration into high-end export markets. Public financial data shows that the gross profit margins of some companies' power unit segments range from a high teens to a high 40s of percentage points (depending on their product mix and channel structure), while some companies focused on the mid- and low-end market or exposed to raw material fluctuations have lower gross profit margins with greater volatility. Overall, the main paths to improving gross profit margins are shifting towards the high-end market, increasing the in-house production rate (for key pumps, valves, and servo motors), and capturing lifecycle value through after-sales service and long-term maintenance contracts.
