## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The most common AC-response accelerometers use piezoelectric elements for their sensing mechanism. Under acceleration, the seismic mass of the accelerometer causes the piezoelectric element to “displace” a charge, producing an electrical output proportional; to acceleration. Electrically, the piezoelectric elements look like a source capacitor with a finite internal resistance, typically in the order of 10<sup>9</sup> ohms. This forms the RC time constant which defines the high-pass characteristics of the device. For this reason, piezoelectric accelerometer cannot be used to measure static events. Piezoelectric elements can be natural or man-made. They come with varying degrees of transduction efficiency and linearity characteristics. Two types of piezoelectric accelerometer are available on the market – charge output type and voltage output type.
