The global Accelerometer Calibrator market size is predicted to grow from US\$ 561 million in 2025 to US\$ 786 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

An accelerometer calibrator is a sensor that can measure acceleration. It usually includes one or more sensors that measure acceleration and compare it to other known standards. Through the calibration process, the output of the accelerometer can be adjusted to match the expected value, thereby ensuring that the device's navigation, motion detection or other acceleration-related functions are accurate and reliable. The working principle of the accelerometer calibrator is based on Newton's second law, that is, force equals mass multiplied by acceleration. During the acceleration process, the sensor measures the inertial force exerted on the mass block and calculates the acceleration value. The calibrator usually contains parts such as mass blocks, dampers, elastic elements, sensitive elements and conditioning circuits, which work together to complete the measurement and calibration of acceleration.
