Abstracts

The global Acetylxylan Esterase market size is predicted to grow from US$ 72.54 million in 2025 to US$ 90.72 million in 2032; it is expected to grow at a CAGR of 3.3% from 2026 to 2032.

In 2024, global production of acetylxylan esterases reached 440.9 tons, with an average selling price of $163/kg.

Acetylxylan esterases are key members of the carbohydrate esterase family and belong to the hydrolase class. Their core function is to specifically catalyze the hydrolysis of acetyl groups in xylan molecules. By cleaving the acetyl ester bonds (R-COO-CH?) at the C2 and/or C3 positions of the xylose unit, they convert the acetyl groups into acetic acid and release the acetyl groups, thereby removing the steric hindrance of the acetylated xylan side chains on the main chain. This process significantly enhances the accessibility of endoxylanases and cellulases to the complex structure of lignocellulose, making them key auxiliary enzymes for efficient lignocellulose degradation.

The upstream industry for acetylxylan esterases includes microbial strains and genetic engineering tools (Thermococcus, Pichia pastoris KM71H, and gene cloning and expression systems), with representatives including SDIC Biotechnology Investment Co., Ltd.; the midstream industry focuses on enzyme fermentation production and purification processes (recombinant expression systems, fermentation condition optimization, and catalytic properties research); and the downstream industry focuses on polyethylene terephthalate degradation, papermaking sticky control, and food processing.
