Anisotropic Conductive Film (ACF) is a special material used for the connection of integrated circuit (IC) chips that allows current to pass in a specific direction while maintaining electrical insulation. ACF is a key material in semiconductor packaging, where it is used for the connection between the chip and the substrate, and is particularly common in areas such as flexible circuit boards (FPCs). Anisotropic Conductive Film is a thin, flexible polymer film with tiny conductive spherical particles attached to its surface. These particles are uniformly distributed and are typically made of gold (Au), nickel-palladium (NiPd), or other metals. ACF is designed to allow current to pass only in the vertical direction of the film (in the direction of the particle layer) while remaining electrically insulated horizontally (in the plane of the film).
