The global ACF Bonders market size is predicted to grow from US\$ 423 million in 2025 to US\$ 682 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

An Anisotropic Conductive Film (ACF) Bonder is a specialized machine used to bond electronic components, such as flexible circuits (FPC), chips, and display panels, using anisotropic conductive film (ACF) as an adhesive and conductive interconnect. ACF Bonders apply heat, pressure, and time to create strong, electrically conductive, and mechanically secure connections.

The increasing miniaturization of electronics is driving the demand for precise and high-performance bonding.

ACF bonders are essential for the bonding of flex circuits to substrates, especially in touchscreens and display panels. This is particularly true in smartphones, tablets, and wearables where compactness and flexibility are critical.

As OLED and MicroLED displays gain popularity, especially in high-end consumer electronics, there is a growing need for flexible, fine-pitch interconnects.

ACF bonders play a crucial role in COF (Chip-on-Film) and FOG (Flex-on-Glass) bonding processes. As manufacturers aim to improve display resolution and flexibility, ACF bonders are vital to achieving high-density bonding in thin, flexible displays.

Modern vehicles incorporate advanced display panels, infotainment systems, and driver-assistance systems (ADAS), all of which require flexible and robust electronic bonding.

The automotive industry's need for reliable, high-performance connections is driving the

demand for ACF bonders, particularly for bonding flexible circuits to display panels and sensors that must endure harsh conditions (vibrations, temperature extremes).
