The global Acid-based Fluids Gelling Agents market size is predicted to grow from US\$ 106 million in 2025 to US\$ 138 million in 2032; it is expected to grow at a CAGR of 4.0% from 2026 to 2032.

Acid-based Fluids Gelling Agents are functional additives used to increase the viscosity of acid fluids during oil and gas well acidizing and acid fracturing operations. Also known as acid thickeners, their primary function is to increase the viscosity of hydrochloric acid, organic acid, mud acid, or composite acid systems. This serves to reduce the rate of the acid-rock reaction and fluid loss, extend the effective reach of the active acid, and improve fracture etching and diversion performance.

Upstream raw materials primarily include acrylamide, cationic monomers, zwitterionic monomers, cross-linking monomers, emulsifiers, initiators, mineral oils, surfactants, stabilizers, pH adjusters, and solvents. Downstream applications involve production enhancement operations such as matrix acidizing, acid fracturing, diverting acidizing, and near-wellbore cleanup.

In 2025, global sales volume for acid gelling agents is approximately 18,000 metric tons, with an average market price of around \$6,000 per ton; major manufacturers in the industry report gross margins of approximately 25%-40%.

The industry falls within the specialized functional materials segment of oil and gas field production-enhancement chemicals. Demand is primarily driven by operations such as carbonate acidizing, deep-well acid fracturing, the revitalization of mature wells, and unconventional oil and gas stimulation. The core value of these materials lies in their ability to increase acid viscosity, retard the acid-rock reaction, improve acid diversion,

and minimize near-wellbore damage. Key industry drivers include the rising natural decline rates of mature oil and gas fields, necessitating the use of cost-effective stimulation techniques?such as acidizing and acid fracturing?to maintain production levels. Concurrently, the increasing development of deep, high-temperature, and high-salinity reservoirs has created a demand for gelling systems that offer superior temperature and acid resistance, as well as low residue and minimal formation damage, thereby driving product upgrades.
