## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The working principle of the spray tower: the acid mist exhaust gas is introduced into the purification tower through the air duct. After passing through the packing layer, the exhaust gas and the sodium hydride absorbent are fully contacted with the gas and liquid to absorb and neutralize the gas. After purification, the acid mist exhaust gas is dehydrated and removed by the soot board, and then discharged into the atmosphere by the fan. After the bottom of the tower is pressurized with a water pump, the absorbent is sprayed down from the top of the tower, and then recycled to the bottom of the tower. The purified acid mist exhaust gas meets the national emission standard.
