The global Acid Yellow 23 market size is predicted to grow from US$ 52.49 million in 2025 to US$ 67.9 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

Acid Yellow 23 — better known as tartrazine, FD&C Yellow No. 5, or C.I. 19140 — is a water-soluble azo food/industrial dye whose industrial manufacture follows classical azo chemistry but scaled and controlled for food-grade and technical applications. The primary raw materials used in commercial production are a sulfonated aromatic amine (most commonly 4-aminobenzenesulfonic acid / sulfanilic acid or its sulfonated diamine derivatives) which is converted into a diazonium salt, and a pyrazolone-type coupling component (often referred to in industry literature as “pyrazolone T” or the 4,5-dihydro-5-oxo-pyrazole derivative). Additional supporting materials include mineral acids and nitrite sources for diazotization, alkalis or carbonate salts to control coupling pH, solvents and salts for crystallization and purification, and finishing aids such as anti-caking agents when producing dry powders or lake products. In industrial practice production is executed as a multi-stage sequence: first the sulfonated aromatic amine feedstock is converted to its diazonium derivative under carefully controlled nitrosation/diazotization conditions; that reactive diazonium intermediate is then immediately coupled with the pyrazolone derivative in a separate reactor under conditions chosen to favor selective azo-bond formation and to control particle form and solubility; finally the crude azo product is neutralized, washed, filtered, and brought through one or more purification/crystallization and drying steps to meet colour strength, purity and residual-amine limits required for the end use (food, pharma, textile, etc.). Modern plant practice emphasizes strict control of by-products (e.g., inorganic salts, small-molecule impurities) and of residual nitrosamines due to regulatory and safety concerns; finishing steps therefore often include additional wash/filtration stages, ion-exchange or activated-carbon treatment, and standardized drying (spray or drum drying) to produce a stable granular or powdered trisodium salt or lake form.
