The global Acidic Colloidal Silica market size is predicted to grow from US\$ 86.1 million in 2025 to US\$ 112 million in 2031; it is expected to grow at a CAGR of 4.5% from 2025 to 2031.

Colloidal silica is silica particles that are suspended in a liquid. The liquid is denser than water and has been stabilized electrostatically to allow the particles to stay suspended in the solution. The silica particles are also very small and do not have a large density. If the particles are too large, they will settle out of the solution. If the silica particles are too small, they are difficult to stabilize in a solution. Colloidal silica is not only available in bulk deliveries, but also in plastic drums and IBCs.

The pure silica sols are anionic and are typically sodium- or ammonium-stabilized to a pH of 9-11. Through modification using sodium aluminate, however, the sols are stable down to a pH of 3-4. Cationic silica sols are stable at pH 4-5, and deionized sols are stable at a low pH, typically 2-3.

From the different types of acidic colloidal silica, the particle size 10-20 nm type held the maximum market share with over 63% in 2019.

From the perspective of applications, the catalysts took the first place with 42% market share in 2019, while textile industry occupied 22% of the market share.
